

Departmental Workflows, Data Inventory, ERP Module Mapping & Future-State Design

Baraka Mini Mart

This document combines four steps of the ERP back-office workflow into a single reference: separating the business into independent workflows, identifying the data each workflow generates, mapping each workflow to the ERP module that will eventually support it, and designing the improved future-state process.

Part	Phase	Deliverable
A	Separate Individual Business Processes	Departmental Workflow Documents
B	Identify Business Data	Data Inventory
C	Match Business Processes to ERP Modules	ERP Module Mapping
D	Design the Future-State Workflow	Future-State Workflow Design

Part A — Departmental Workflows

Five independent workflows were identified. Each is documented start to finish, with the responsible role noted under every step.

A.1 Sales Process

Starts: Customer initiates a purchase

Ends: Sale recorded in the sales notebook

Departments involved: Customer, Shop Attendant, Cashier

A.2 Procurement / Purchasing Process

Starts: Low stock is identified

Ends: Goods received, confirmed, paid for, and logged

Departments involved: Storekeeper, Shop Attendant, Manager, Supplier

A.3 Inventory Management Process

Starts: Stock is received from a supplier

Ends: Shelves stocked; damaged/expired items reported

Departments involved: Storekeeper, Shop Attendant

A.4 Credit Management (Accounts Receivable) Process

Starts: A sale is made on credit

Ends: Balance settled or remains outstanding

Departments involved: Cashier, Manager, Customer

A.5 Finance Operations Process

Starts: Daily notebooks are updated

Ends: Taxes filed

Departments involved: Manager, External Accountant

Part B — Business Data Inventory

For every workflow in Part A, this section lists the data the ERP system will need to capture and manage.

B.1 Customer Data

Data Field	Purpose / Notes
Customer Name	Identifies who owes money or placed a phone/text order
Phone Number	Needed to receive and confirm phone/text orders, and for credit follow-up
Credit Balance	Running total a customer currently owes Baraka
Customer Type	Walk-in vs. regular / credit customer (optional, aids reporting)

B.2 Product Data

Data Field	Purpose / Notes
Product Name	e.g. “Maize Flour 2kg”
Category	Food & Groceries, Beverages, Household Items, Snacks, Personal Care, Other
Unit of Measure	kg, litre, piece, packet, etc.
Cost Price	What Baraka pays the supplier
Selling Price	What the customer pays
Current Stock Quantity	Supports the “stock levels” report
Reorder Level	Threshold that should trigger a reorder
Expiry Date	For perishables — milk, bread, eggs; supports the “near expiration” report

B.3 Supplier Data

Data Field	Purpose / Notes
Supplier Name	—
Contact Info	Phone / WhatsApp — matches how the Manager already reaches suppliers
Products Supplied	Links supplier to the product catalogue
Payment Terms	Immediate or on credit
Amount Owed to Supplier	Baraka's payable balance — supports the “money client owes” report

B.4 Sales Transaction Data

Data Field	Purpose / Notes
Date & Time	—
Sales Channel	Walk-in or Phone/Text
Products Sold & Quantities	—
Total Amount	—
Payment Method	Cash, M-Pesa, or Credit
Cashier	Which employee handled the sale — supports that reporting requirement
Receipt Issued	Yes / No — receipts are currently issued only on request

B.5 Procurement Transaction Data

Data Field	Purpose / Notes
Date	—
Supplier	—
Products & Quantities Received	—
Total Cost	—
Payment Status	Paid or on credit
Invoice / Delivery Note Reference	—

B.6 Credit Transaction Data

Data Field	Purpose / Notes
Customer Name	—
Amount Owed	—
Date Incurred	—
Amount Repaid	—
Balance Remaining	—
Status	Outstanding or Settled

B.7 Employee Data

Data Field	Purpose / Notes
Name	—
Role	Manager, Cashier, Shop Attendant, or Storekeeper

B.8 Financial Summary Data

Data Field	Purpose / Notes
Daily Total Sales	—
Cash vs. M-Pesa Split	Supports the “cash collected vs. M-Pesa received” report
Daily Profit	Requires cost price to be captured against each sale
Outstanding Receivables	Total credit owed to Baraka by customers
Outstanding Payables	Total credit Baraka owes suppliers

Part C — ERP Module Mapping

Each workflow from Part A is matched to the ERP module that will eventually run it.

Business Process	ERP Module	Notes
Sales Process (Walk-in & Phone/Text)	Sales / POS	Needs a channel field to distinguish walk-in from phone/text
Procurement Process	Purchase	Supplier invoices & delivery notes become purchase orders / bills
Inventory Management	Inventory	Replaces the notebook; enables expiry and reorder alerts
Credit Management (Receivables)	Accounting — Receivables	Repayment/follow-up process still needs validation
Finance Operations	Accounting	Feeds the weekly external accountant review
Customer Records	CRM (lightweight)	Mainly for credit and repeat phone/text customers
Supplier Records	Purchase — Vendor Management	Tracks payables and supplier terms
Employee Sales Attribution	Sales / User Management	Supports the “which employee handled each sale” report

Part D — Future-State Workflow

This section designs an improved version of Baraka Mini Mart's current process, per the guiding questions: can unnecessary steps be removed, can approvals be streamlined, can repetitive tasks be automated, and can information flow more efficiently between departments? Roles stay the same throughout — the redesign changes how work is recorded and shared, not who does it.

D.1 Design Principles

- Improve the process first, then automate it — no step is automated just because it can be.
- Every transaction is entered once, at its source, instead of re-written across separate notebooks.
- Human judgment stays with people: supplier relationships, approvals, and exceptions remain with the Manager.
- System-handled steps are shown in teal below; human steps stay in the grey style used throughout this document.

D.2 What Changes

Current Pain Point	Future State
Stock levels & expiry hard to track	Real-time inventory in the system, with automatic low-stock and near-expiry alerts
Sales and revenue mismatch	Every sale recorded once, in-system; cash vs. M-Pesa auto-reconciled daily
No visibility into best-selling products	Automatic sales-by-product reporting, on demand
Can't keep track of suppliers	Supplier records hold purchase history and a running payable balance
Credit sales tracking is a burden	Digital receivables ledger with live balances per customer (collection policy still to be defined with James)
Four separate notebooks (inventory, sales, credit, suppliers)	One system of record; each transaction entered once
Manager manually reviews notebooks; accountant compiles by hand over the weekend	Manager and accountant pull reports directly from the system

D.3 Future-State End-to-End Flow

Accountant pulls system-generated reports — on-site or remotely

External Accountant

Accountant files taxes

External Accountant

Every sale updates inventory in real time
