

Odoo 19 Configuration Checklist

Baraka Mini Mart

This checklist translates the Future-State Workflow (Part D) into concrete Odoo 19 setup steps, organized by app. Every item is grounded in how Odoo 19 actually works — not a generic template — and cross-checked against Odoo's official 19.0 documentation.

App Overview

Six areas of Odoo 19 are relevant to Baraka Mini Mart, mapped back to the Part C ERP Module Mapping:

Odoo 19 App	Maps to (Part C)	Role in Baraka's Operation
Contacts	Sales / CRM / Purchase (shared)	Single record for every customer and supplier
Point of Sale	Sales / POS	Walk-in and phone/text checkout, cash & M-Pesa & credit
Inventory	Inventory	Replaces the stock notebook; stock levels & expiry
Purchase	Purchase	Replaces the supplier notebook; vendor bills
Accounting	Accounting	Replaces manual weekend compilation; VAT & M-Pesa
Settings / Users	User Management	Logins and access per role

1. Company & General Settings

- ☐ Company profile: name, address, logo, phone number
- ☐ Currency set to Kenyan Shilling (KES)
- ☐ Fiscal localization package set to Kenya
- ☐ Confirm VAT registration status — *confirm with James.*
- ☐ Time zone set to Africa/Nairobi

2. Contacts (Customers & Suppliers)

- ☐ Import/create supplier contacts from the supplier notebook
Name, phone/WhatsApp, payment terms (immediate or credit)
- ☐ Create customer contacts for regular / credit customers
Walk-in one-off customers do not need individual records
- ☐ Set a credit limit per credit customer
Odoo's Point of Sale has a built-in 'maximum sales credit' per customer — the actual limit amounts are a policy decision, still to be defined with James

3. Point of Sale

Odoo 19's Point of Sale includes a built-in Customer Account payment method that lets a customer buy now and settle later — with an optional maximum credit limit that visually warns the cashier once reached. This is a close match for how Baraka already handles credit sales.

- ☐ Create one Point of Sale register for the shop counter

- ☐ Create product categories
Food & Groceries, Beverages, Household Items, Snacks, Personal Care, Other
- ☐ Load products with cost price and selling price
- ☐ Enable barcode use if products carry barcodes (optional, speeds up checkout)
- ☐ Configure payment methods: Cash
- ☐ Configure payment methods: M-Pesa
Set up as its own payment method / journal so cash vs. M-Pesa reporting is automatic
- ☐ Configure payment methods: Customer Account (credit)
Odoo 19's built-in 'pay later' option — ties directly into the Accounting Receivables ledger
- ☐ Enable per-cashier login on the POS
Supports the "which employee handled each sale" report
- ☐ Set receipt printing to on-request
Matches current practice — receipts issued only when asked for

4. Inventory

Odoo 19 tracks expiration dates once Lots & Serial Numbers are enabled, and can trigger reorders automatically once stock drops below a set minimum — directly replacing the two gaps flagged earlier (notebook-based stock recording, and manual reorder triggering).

- ☐ Set up a single warehouse and storage location for the shop
- ☐ Set units of measure per product
kg, litre, piece, packet, etc.
- ☐ Enable Lots & Serial Numbers, then Expiration Dates
Inventory app → Configuration → Settings → Traceability. Needed for milk, bread, eggs, and any other perishables
- ☐ Set a reorder point (minimum quantity) per product
- ☐ Set a maximum / target stock quantity per product
- ☐ Choose Auto or Manual trigger for reordering rules
Auto creates a draft purchase automatically when stock drops below the minimum; Manual lists it on a replenishment report for the Manager to action

5. Purchase

- ☐ Confirm vendor records carry the correct payment terms (immediate or credit)
- ☐ Set the Manager as the sole purchase approver
Matches the current process — no additional approval hierarchy exists today
- ☐ Decide whether Purchase Orders are raised in-system or contact remains by phone/WhatsApp with the bill entered afterward — *confirm with James*
Either works in Odoo; this is a preference to confirm, not a system limitation

6. Accounting

Odoo 19 ships a Kenya-specific Chart of Accounts and a native KRA eTIMS (OSCU) integration for electronic tax invoices, alongside support for M-Pesa as a payment method — all standard, not custom development.

- ☐ Install the Kenya Chart of Accounts template
- ☐ Review and confirm tax rates once VAT status is confirmed — *confirm with James*
- ☐ Set up journals: Sales, Cash, M-Pesa/Bank, Purchases, Miscellaneous
- ☐ Confirm the Accounts Receivable account is linked to the Customer Account (credit) payment method

- ☐ Set up a weekly report export or direct system access for the external accountant
Replaces the Saturday notebook hand-over — Manager and Accountant can both pull the same reports directly
- ☐ Define the credit follow-up / collection policy — *confirm with James*
Carried over from Part D — this is a business decision, not a configuration step, and should be settled before Receivables go live

7. User Management

- ☐ Create a user account for the Manager
Full access — Sales, Inventory, Purchase, Accounting, Settings
- ☐ Create user accounts for each Cashier
Point of Sale access only
- ☐ Create a user account for the Storekeeper
Inventory access only
- ☐ Create a user account for the Shop Attendant
Inventory — view/limited access, matching their role of flagging low stock
- ☐ Confirm approval hierarchy stays single-tier
Manager approves purchases and any credit exceptions — no additional layers, matching current practice

For traceability, here is how each business process maps to the Odoo 19 app that now implements it:

Business Process	Odoo 19 App
Sales Process (Walk-in & Phone/Text)	Point of Sale
Procurement Process	Purchase
Inventory Management	Inventory
Credit Management (Receivables)	Accounting — Receivables (Customer Account)
Finance Operations	Accounting
Customer Records	Contacts
Supplier Records	Contacts / Purchase
Employee Sales Attribution	Point of Sale — per-cashier login
